Table 4-10: Attended Noise Monitoring Results.....	13

# 1. Introduction

- 1.1.1 This appendix presents the methodology and results of the baseline noise monitoring carried out to inform the construction and operation and maintenance noise assessments. Noise monitoring locations were determined based on the Site location with respect to nearby noise-sensitive receptors.
- 1.1.2 A number of other factors were also taken into consideration when identifying these locations, including:
  - a. Safety of the surveyors;
  - b. Security of monitoring equipment; and
  - c. Site accessibility.

## 2. Noise Monitoring Methodology

- 2.1.1 Baseline noise monitoring was carried out to establish the existing noise climate in the area around the Site. The monitoring procedures followed guidance from British Standards (BS) 7445-1:2003 Description and measurement of environmental noise – Part 1: Guide to quantities and procedures (Ref. 1) and BS 4142:2014+A1:2019 Methods for Rating and Assessing Industrial and Commercial Sound (Ref. 2). Acoustic field calibrators were applied to each instrument at the start and end of each measurement to check the calibration levels.
- 2.1.2 Each unattended sound level meter was housed within a weatherproof box with batteries to power the instrument for the full measurement duration. Appropriate outdoor all-weather equipment was used on all microphones. All noise measurements included LAeq, LA90, and LAFmax sound level indicators over 1-hour contiguous periods.

### 3. Meteorological Conditions

- 3.1.1 A weather station was set up at one location during each tranche of monitoring. The weather station measurement included windspeed (m/s), wind direction, rainfall (mm), and temperature (°C). Periods of wind higher than 5 m/s have been excluded from the analysis and are detailed in Section 4.

## 4. Survey Results

4.1.1 The baseline noise monitoring results of unattended measurements are presented in Table to Table . Table 4-1 presents the dates of noise monitoring and any reasoning for excluded data during the relevant measurement period. Data has been excluded from the overall averaging of results at locations where adverse weather and atypical data (anomalous spikes in noise data that are likely due to activity in the immediate area to the noise monitor) were experienced. Additional baseline noise monitoring results of attended measurements along the Grid Connection Corridor are presented in Table . Time-history graphs detailing periods of adverse weather conditions are presented in Plate 4-1 to Plate 4-8.

**Table 4-1: Noise Monitoring Dates**

<b>Monitor Location</b>	<b>Start Date</b>	<b>End Date</b>	<b>Excluded Data</b>
ML1	29/11/2023	07/12/2023	Rain Exclusions
ML2	07/12/2023	14/12/2023	Rain and Wind Exclusions
ML3	07/12/2023	14/12/2023	Rain and Wind Exclusions
ML4	Monitoring Location Inaccessible		
ML5	07/12/2023	14/12/2023	Rain and Wind Exclusions
ML6	07/12/2023	14/12/2023	Rain and Wind Exclusions
ML7	29/11/2023	07/12/2023	Rain Exclusions
ML8	29/11/2023	07/12/2023	Rain Exclusions
ML9	29/11/2023	07/12/2023	Rain Exclusions
